CATALOGUE OF METEOROLOGICAL SATELLITE DATA—TIROS IX TELEVISION CLOUD PHOTOGRAPHY

Part 1

WASHINGTON, D. C. : 1966

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 - Price $1.75

PURPOSE

The Key To Meteorological Records Documentation Series has been established to provide guidance information to research personnel making use of climatological data.

Frequently users of such data have found it necessary to spend a great deal of time establishing whether the criteria for observing or computing various elements have changed over the period of record or in what form the data are available.

It is therefore hoped that the presentation of this series may not only conserve valuable time but may have a direct influence in improving the accuracy of research results.

PREFACE

This bulletin is number one in a series of catalogues describing the television cloud photographs obtained by TIROS IX meteorological satellite. Material in this issue covers the period of January, February, March, and April of 1965. Similar material covering subsequent periods of this satellite's operation will be published in separate catalogues. The maps and listings generally follow the pattern established in the "Catalogue of Meteorological Satellite Data - TIROS I Television Cloud Photography," published as No. 5.31 in the Weather Bureau Series Key To Meteorological Records Documentation. However, emphasis is placed on the date and track number as a means of identifying the film. Also, because of the length of the picture taking area of TIROS IX, there are three maps for each day: Northern Hemisphere, Equatorial, and Southern Hemisphere. The maps are arranged according to pass day.

EARLIER TIROS DATA CATALOGUES

Catalogues of earlier TIROS Meteorological Satellite data are available in this series, as follows:

No. 5.31 "Catalogue of Meteorological Satellite Data - TIROS I Television Cloud Photography", published in 1961, price 70 cents.

No. 5.32 "Catalogue of Meteorological Satellite Data - TIROS II Television Cloud Photography", published in 1963, price 20 cents.

No. 5.33 "Catalogue of Meteorological Satellite Data - TIROS III Television Cloud Photography", published in 1962, price 70 cents.

No. 5.34 "Catalogue of Meteorological Satellite Data - TIROS IV Television Cloud Photography", published in 1963, price $1.00.

No. 5.35 "Catalogue of Meteorological Satellite Data - TIROS V Television Cloud Photography", published in 1964, price $1.75.

No. 5.36 "Catalogue of Meteorological Satellite Data - TIROS VI Television Cloud Photography", published in 1964, price $2.00.

No. 5.37 "Catalogue of Meteorological Satellite Data - TIROS VII Television Cloud Photography Part 1 June 19, 1963 to December 31, 1963", published in 1965, price $1.25.

No. 5.37 "Catalogue of Meteorological Satellite Data - TIROS VII Television Cloud Photography Part 2 January 1, 1964 to June 30, 1964", published in 1965, price $1.00.

No. 5.37 "Catalogue of Meteorological Satellite Data - TIROS VII Television Cloud Photography Part 3 July 1, 1964 to December 30, 1964", published in 1965, price $1.00.

No. 5.37 "Catalogue of Meteorological Satellite Data - TIROS VII Television Cloud Photography Part 4 January 1, 1965 to December 31, 1965", published in 1966, in press.

No. 5.38 "Catalogue of Meteorological Satellite Data - TIROS VIII Television Cloud Photography Part 1 December 21, 1963 to June 30, 1964", published in 1965, price $1.00.

No. 5.38 "Catalogue of Meteorological Satellite Data - TIROS VIII Television Cloud Photography Part 2 July 1, 1964 to December 31, 1964", price $1.00.

CATALOGUE OF METEOROLOGICAL SATELLITE DATA --
TIROS IX TELEVISION CLOUD PHOTOGRAPHY
PART 1 - January 22, 1965
to April 30, 1965

The TIROS IX meteorological satellite was launched by the National Aeronautics and Space Administration on January 22, 1965. Traveling in an elliptical orbit, it averaged about 885 nautical miles above the earth's surface, with a difference of 1013 nautical miles between apogee and perigee. It has an orbital period of 119.09 minutes which corresponds to slightly more than 12 passes around the earth each day. The orbit was inclined at an angle of 96.4° (83.6° retrograde) to the earth's equatorial plane and thus virtually global picture coverage was obtained.

TIROS IX was a standard TIROS satellite modified to a "cartwheel" configuration to obtain earth-oriented picture coverage. Like previous satellites in the TIROS series, it was spin-stabilized, spinning about its axis at a rate that varied between 8 and 12 rpm. However, once the satellite was in orbit, it was maneuvered so that the spin axis was aligned perpendicularly to the orbital plane. Thus, in its final orbital attitude, TIROS IX rolled along its orbit on its side like a wheel.

Its two cameras, both of which had a wide-angle lens, were mounted 180° apart and viewed out through the cylindrical side of the spacecraft. By detecting the passage of the horizons with an IR (infrared) sensor during each rotation of the satellite, the cameras were triggered to take pictures when pointed downward. In order to eliminate picture gap between adjacent passes, each camera was tilted at an angle of 26.5° to the plane of rotation, one to the left and the other to the right. As the satellite spun, pictures obtained by the two cameras overlapped directly beneath the satellite and also had sufficient width perpendicular to the orbital track to overlap pictures taken on the next earlier and later passes. The area viewed by both cameras during a pass day varied from all the sunlit portion of the earth at apogee to about half of the earth at perigee.

From launch date to April 7, 1965, camera 1 was looking to the east of the satellite path and camera 2 to the west. Because of the precession of the orbit, however, it became necessary to turn the satellite 180° to maintain a favorable angle between the sun line and the array of solar cells on the satellite. This maneuver was completed on April 9, 1965, and camera 2 was then pointing to the east and camera 1 to the west. The pictures being taken by camera 1, however, had begun to deteriorate during late March and became unusable by April 1, 1965. After that date pictures were taken only by camera 2.

Camera action aboard TIROS IX was controlled from three Command-and-Data-Acquisition (CDA) stations: one located at Wallops Station near Chincoteague, Va.; one at Pacific Missile Range, Point Mugu, Calif.; and the other at Gilmore Creek, Fairbanks, Alaska. The station at Point Mugu, Calif. ceased operations on April 15, 1965. The satellite came within radio range of one or more of these stations for a few minutes each on 9 or sometimes 10 of its 12 daily passes. During these radio contacts the station could:

1. if it was daytime, receive a series of television pictures directly as they were taken;
2. command the system to take pictures remote from the CDA station after a specified time delay and store them on tape aboard the satellite;
3. play back one previously commanded tape sequence from each camera.

Tape pictures were obtained in sequences up to 48 frames each. Direct sequences were usually shorter and more variable in length. The time interval between frames was 30 seconds in most direct sequences, and was either 32, 64, or 128 seconds in tape sequences.

The pictures are virtually square with some small distortion resulting from the particular setting of the electronic readout equipment. "Fiducial marks" etched on the face of the vidicon tube appear in the picture image as a central cross and four L-shaped corners, although they may show poorly or not at all against a dark background. For each camera, the principal point (i.e., the intersection of the optical axis of the camera with the image plane) is at the intersection of the two lines that form the central cross mark.

Cloud picture transmissions received at CDA stations were displayed on a television screen and simultaneously recorded on magnetic tape. A 35 mm. camera photographed the television screen, including also a lighted panel board mounted underneath. The panel board information provides a legend for each picture including camera number, mode (TAPE or DIRECT), frame number, orbital pass number, and station initial preceded by "IX" for TIROS IX. Occasionally a clock appears in the legend but the time shown has no relation to picture taking time.

In the example of figure 1, the legend indicates the picture was received and taken on orbital pass number 646 and that it is a TAPE picture taken by camera 1. The letter "W" at right center following the number "IX" indicates the picture was acquired at Wallops Station.

The panel board legend also contains a series of numerals whose sum indicates the frame number. In figure 1, the frame number is 3, representing the sum of 1 and 2. Within each sequence, the indicated frame numbers increase in the order that the pictures were received at the CDA station. For direct mode this is the time order in which the pictures were taken. But tape sequences were played back to the station in reverse time order. Pictures of both modes are arranged on the film in order of increasing frame number; therefore it is important to note that this arrangement is correct time order for direct sequences, but is reverse time order for tapes.

The orderly time sequence of pictures is sometimes interrupted by spurious noise frames or complicated by skipped frames. In such cases the frame numbers are not a dependable indicator of real picture counts.

For TIROS IX a new system of "Tracks" is used to identify the general geographic areas over which picture sequences were taken. These tracks are shown on the locator map (fig. 2) and track table (table 7) which appear in this catalogue immediately following the tabulated listings. The track boundaries are parallel to the path followed by the sub-satellite point during the daylight portion of each orbital pass. The width of each track is exactly equal to the amount the earth rotates between consecutive passes. Thus, in general, the satellite sub-point makes one traverse along each track each day (from midnight to midnight, GMT). The track boundaries are fixed permanently for the life of TIROS IX, and are arbitrarily referenced to the point 0° latitude, 0° longitude, with track numbers increasing westward.

Since the TIROS IX orbital period of 119.09 minutes is not an exact submultiple of 24 hours, the satellite starts 12 passes on most days and 13 on about every tenth day. This results in Track 13 being much narrower than the others and, thus, it will not be traversed every day. There are also days on which one particular track is traversed just after GMT midnight, and again later the same day just before GMT midnight. On these occasions, the second traverse is designated by the track number followed by the letter A. For example, if the track traversed twice in a day were 6, the first traverse would be 6 and the second 6A. There would, in this case, be a corresponding day without a traverse of Track 6. Assignment of Track 6 to one day or another is determined by the GMT time at which the sub-satellite point crossed the equator near the midpoint of the track.

On the film reels, picture sequences are grouped together by track number and assembled in chronological order. Track numbers are stamped on the film immediately preceding the sequences to which they apply.

Figure 1 - Example of TIROS IX Cloud Photography

The following pages of maps and tabulated listings give descriptive information about the pictures obtained by TIROS IX. In the listings each picture sequence is described by one line, and the sequences are grouped together by date and track number. This is in the order in which they appear on the film reel. The column headings and entries have the following meanings:

REEL: Number of the film reel which contains the sequence.

DATE: For tape (remote) sequences - Month and day of the daylight equator crossing of the satellite sub-point.

For direct sequences - Month and day of the midpoint time of the sequence.

TRACK: Defines the geographic area which contains the path of the sub-satellite point. The entries refer to the numbered areas outlined on the first map in this catalogue.

TIME: Approximate time in hours and minutes

(a) For tape sequences - daylight equator crossing
(b) For direct sequences - midpoint time of sequence

FILM LEGEND: This section gives the information actually appearing on the film in the panel board legend accompanying each picture.

PASS: Orbital pass number on which the pictures were read out, as indicated in the upper right corner of the legend.

M: Mode of transmission indicated in the legend.

D = Direct
T = Tape

C: Camera number indicated in the legend.

1 = Camera number one
2 = Camera number two

S: CDA station which received the sequence.

W = Wallops Station, Va.
P = Point Mugu (Pacific Missile Range), Calif.
F = Fairbanks, Alaska

P/T PASS: Orbital pass number on which the pictures were taken. On the composite maps in this catalogue, this number appears beneath the nephanalysis for the picture sequence.

FRAME:
TI: Time interval, in seconds, between frames. V indicates time interval varies within the sequence.

US: Number of usable frames in the sequence.

METEOROLOGICAL AND OTHER FEATURES:

EXTRATROPICAL CIRCULATIONS - TABLE (1)

0. CLOUD VORTEX (Well Defined)
1. CLOUD VORTEX (Poorly Defined)
2. CLOUD VORTEX (With Frontal Band or Other Associated Band(s))
3. CLOUD VORTEX (WITH DOUBLE CENTER)
4. CIRCULATION CENTER
5.
6.
7.
8.
9. CLOUD VORTEX (Unusual Appearance)

TROPICAL DISTURBANCES - TABLE (2)

0. Hurricane or TYPHOON (Named)
1. Tropical STORM (Named)
2. CLOUD VORTEX (Well Defined)
3. CLOUD VORTEX (Poorly Defined)
4. DISTURBED AREA (2° or less in extent)
5. DISTURBED AREA (2° to 4° in extent)
6. DISTURBED AREA (Over 4° in extent)
7. ASYMPTOTES OF CONVERGENCE
8. APPARENT ITC ZONE
9.

BANDS - TABLE (3)

0. PROBABLE FRONT (Well Defined)
1. PROBABLE FRONT (Poorly Defined)
2. APPARENT OCCLUDED FRONT
3. APPARENT STABLE OR OPEN WAVE
4. PROBABLE FRONT (With Cloud Vortex)
5. BAND, LOW LATITUDE (Within 15° of the Equator)
6. BAND, HIGH THIN CLOUDS (Possible Jet Association)
7. PRESUMED NON-FRONTAL
8.
9. BAND OF UNUSUAL APPEARANCE

CLOUD FEATURES - TABLE (4)

0. SOLID CELLS (Random)*
1. SOLID CELLS (Organized Pattern)*
2. HOLLOW POLYGONAL OR CRESCENT PATTERN*
3. VERMICULATED CLOUD PATTERN*
4. COASTAL STRATUS
5. INLAND STRATUS OR FOG (Including Penetrating Coastal Stratus)
6. CLOUD STREETS (Extratropical)
7. CLOUD STREETS (Tropical)
8.
9.

*0, 1, 2 and 3 refer to homogeneous cloud field greater than 3° of great circle arc in diameter

CLOUD FEATURES - TABLE (5)

0. CUMULONIMBUS (No Apparent Organization)
1. CB's or Other Evidence of Violent Weather Over the United States
2. CB's in Apparent Squall Lines
3. EDDY PATTERNS
4. VORTICAL PATTERN IN A CELLULAR FIELD
5. MOUNTAIN WAVE CLOUDS
6. APPARENT GRAVITY WAVES (Not Obviously Associated with Terrain)
7.
8.
9. UNUSUAL CLOUD CONFIGURATION

MISCELLANEOUS - TABLE (6)

0. ICE OR SNOW (Glacial)
1. SNOW (Non-Mountainous)
2. SNOW (Mountain)
3. ICE ON SEAS
4. ICE ON LAKES OR RIVERS
5. SUN GLINT
6. HAZE OR SMOG
7. PROBABLE CONTRAILS
8. LANDMARK OF EXCEPTIONAL QUALITY
9. LANDMARK, DISCERNIBLE

Following the listings is a series of maps which shows the area covered by each sequence having usable frames and for which picture taking time has been determined.

Usually there are three maps (Northern Hemisphere, Equatorial, and Southern Hemisphere) for each Greenwich day. Most of the picture sequences were analyzed for their cloud content during routine operations and these nephanalyses have been reproduced on the maps. Each nephanalysis is identified with the date and track number (preceded by a "T") and the equator crossing number that occurred during the nephanalysis. The track number and date should be utilized as the primary identification of the nephanalysis. When no nephanalysis was available for a usable sequence, a generalized outline of the area covered is shown instead. Satellite attitude and exposure time are not always accurately known at the time the nephanalyses are constructed. However, most of the nephanalyses are considered to be geographically accurate to about ± 2° with a few ranging from ± 1° to ± 5°. Users are cautioned not to attribute any greater accuracy to the location of cloud patterns shown.

The symbols used in the nephanalyses are defined by the following legend:

 CUMULOFORM CLOUD

 STRATIFORM CLOUD

 CIRROFORM CLOUD

 APPARENT CUGG OR CB

 BOUNDARY OF MAJOR CLOUD SYSTEMS - FRONTS, VORTICES, OR OTHER SYSTEM DOMINATING THE SCENE VIEWED BY THE SATELLITE

——— DEFINITE BOUNDARY OF MORE OR LESS UNORGANIZED CLOUD MASSES

— — — INDEFINITE BOUNDARIES OF MORE OR LESS UNORGANIZED CLOUD MASSES

⟵———⟶ STRIATIONS

⟵ — — ⟶ STRIATIONS, TENUOUS

 CLOUD LINES

 CLOUD LINES, TENUOUS - CLOUD FORM DENOTED BY 
⟹ DIRECTION OF SHEAR OF CIRRUS - FROM CB ANVIL OR OTHER SOURCE

 WAVE CLOUDS (MOUNTAIN OR TRANSVERSE)

⟶ ESTIMATED LOCATION OF JET STREAM - SHAFT MAY BE BROKEN TO AVOID OBSCURING SYMBOLS INSIDE NEPH BOUNDARY

VORTEX  HEAVY + THIN —

CLOUD AMOUNT

OPEN (O) = $<$ 20% coverage
MOSTLY OPEN (MOP) = 20-50% coverage
MOSTLY COVERED (MCO) = 50-80% coverage
COVERED (C) = $>$ 80% coverage

NOTE: STIPPLING WILL BE USED TO EMPHASIZE THE AREAS CONSIDERED BY THE ANALYST TO BE OF GREATEST SYNOPTIC SIGNIFICANCE.

TIROS IX master films will be deposited at the National Weather Records Center (NWRC), Environmental Science Services Administration, Federal Building, Asheville, North Carolina. Persons or institutions desiring copies may order them from NWRC in the form of 35 mm. positive transparencies for projection or 35 mm. duplication negatives from which opaque prints can be made. The pictures are stored chronologically on 100-foot reels, and should be ordered by track number and date. Orders must be placed for one or more complete reels, at a cost of $6.50 each, as it is not now possible to furnish copies of individual frames or to provide enlargements or other picture formats. All copies will be furnished with sprocket holes since the necessary film emulsion is available only in this form.

Geographic locator grids, for overlay on the pictures, were computed in the routine preparation of TIROS IX nephanalyses. Microfilm copies of these grids, which have latitude and longitude lines spaced at 5° intervals, are available from the NWRC. The individual nephanalyses will also be available on microfilm. The primary identification of the grids, as well as the pictures and nephanalyses, should be the track number and the date.

Information as to satellite location, height, attitude, picture-taking time, etc., which may be useful in locating TIROS IX pictures more precisely, may be obtained from the Documentation Section, National Environmental Satellite Center, Environmental Science Services Administration, Rockville, Maryland 20852.
